Patrol Management

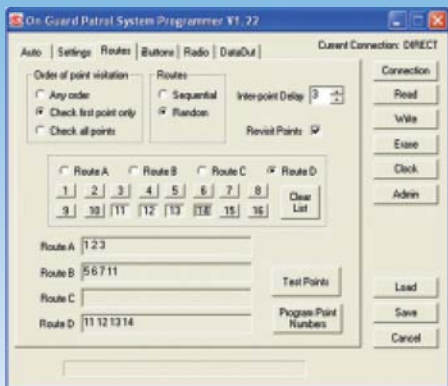

Are your guards destroying your batons?

Batons have long been the downfall of traditional guard systems. OnGuard uses reliable ibutton technology. Each guard can be provided with his own low cost ibutton, making him identifiable. ibuttons are stainless steel casings containing microchip circuitry. They are impact resistant and both chemical and waterproof.

- The cost of replacement tags is a fraction of the cost of traditional batons
- Each guard could be issued with his own tag

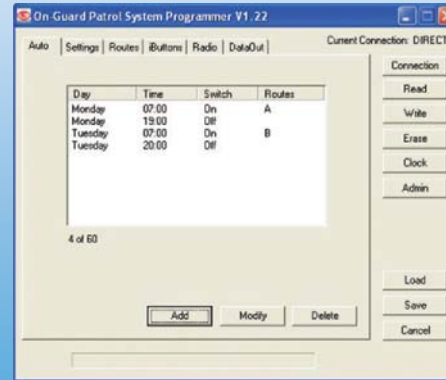

Guards will be prompted by OnGuard to follow programmed routes if invoked. Up to 4 different routes may be selected.

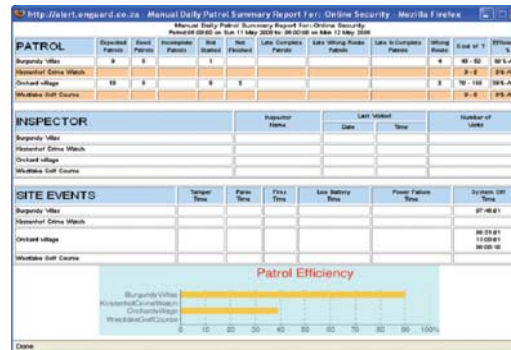

1 to 16 Points may be added

OnGuard has a unique built in programmable schedule.

Transactions are downloaded immediately using GPRS (General Packet Radio Service) on the GSM network. Emails are sent in text form immediately to your control room as well as daily in PDF format to Supervisors or clients.

Sleeping on the baton, a term used for a guard who races around the guard site thus extending his rest period, is preventable by invoking the interpoint delay. OnGuard's microprocessor controlled points will indicate that the guard has visited the point too soon and thus delay his progress.

Stay awake functionality

Does your 2nd guard fall asleep when his colleague is on patrol ?

No longer ! OnGuard will go into stay awake mode depending on the number of guards on duty.

Multiple guards

OnGuard can now send up to 4 guards patrolling simultaneously and report to you on their performance, based on the guard.

Time and attendance

Issue each guard with his own T & A tag and you can draw a report of hours worked.

Supervisor tags...

Know when and how often your supervisors visit your sites.

Simple 'setup' software is supplied with OnGuard. Your laptop can be connected to the controller by a serial modem cable. Programming of patrol periods, rest periods and routes is as simple as ABC. Please visit our web site for price indication and new firm-ware releases.
